

# ENVIRONMENTAL ISSUES FOR CLIMATE CHANGE

# ABOUT US

At Climate Diet, we shed light on a critical, yet often-overlooked climate change culprit—animal agriculture. Recognized as the second-largest producer of human-made greenhouse gas emissions, animal farming is also the leading cause of deforestation, pollution, biodiversity loss, and soil erosion.

[climatediet.org](https://climatediet.org)

Climate change represents a critical environmental challenge with far-reaching consequences for the planet and its ecosystems. Driven by human activities such as deforestation, burning fossil fuels, and industrial emissions, climate change leads to an increase in greenhouse gas concentrations in the atmosphere. These issues highlight the urgent need for global action to mitigate climate change through sustainable practices, renewable energy adoption, and ecosystem conservation.
